Adobe InDesign Adobe's InDesign program is a powerhouse tool for editing text. It features professional-quality web templates, a unique publishing capability that allows designers to create several different versions of a layout, and a dedicated photo or print module that produces gorgeous output. ## Opening Photos and Scanning Documents In the early days of computers, it was common for early hobbyists to create electronic documents with their computers and then print them out on a regular printer. This type of work is still done, and many people scan documents, albums, and photographs into computers so they can easily work on them at home or at a coffee shop. You can also upload digital photos to a blog or website, using a webcam or any other way to transfer the images from your camera. The most basic of blog templates allows you to place an image into a box and insert a link to other pages. All the programs I describe in the following list have a built-in feature for opening and saving JPEG images, so the settings are easy and you won't have to spend a lot of time tweaking to get your images into the correct format. \*\*Adobe Photoshop Elements 6:\*\* This version of the program has the ability to edit RAW image files (such as those produced by your digital camera); however, it doesn't have the ability to edit many of the effects you see in higher-priced versions of

Usually, when a person passes away, their family members do the usual. Flowers, cards, and lots of a heartfelt 'Thank you's' for all the love and support they got. But in the case of two NYPD detectives who both died in the line of duty on Wednesday, the department has turned their families' honors into a moving display of police solidarity. Det. Carlos Enrique Davis III of the NYPD's 71st Precinct and Det. Luis Garcia of the NYPD's 71st Precinct both died Wednesday while "en route to a hospital following injuries sustained in a fire at a location in New York City," the NYPD's commissioner said. "Fellow officers and our department mourn the loss of two dedicated New York City Police Department officers," NYPD Commissioner James O'Neill said in a statement. "Our thoughts and prayers are with the friends and family of Det. Carlos Davis and Det. Luis Garcia during this difficult time." The two detectives were each responding to a report at a residence in the Bronx when they were injured, police told News 4. The fire broke out in the basement of the residence. The fire was reported at the location at approximately 7:15 a.m., but firefighters didn't arrive for nearly 20 minutes, police said. No one else was inside the home at the time. NYPD Chief of Detectives Dermot Shea said the injured officers were transported to a local hospital and that their families were receiving medical attention at the same time. The department announced that hours after the incident, in an unusual show of solidarity, a group of NYPD officers silently stood in tribute to the dead officers. Garcia, 32, worked at the 71st Precinct and Davis, 35, worked at the 79th Precinct. "My heart goes out to the family of Detective Luis Garcia and Detective Carlos Davis," FDNY Commissioner Daniel A. Nigro said in a statement Wednesday. "They are in my thoughts and prayers." "We are thankful that the two officers responded quickly and did everything they could to save the other occupants of the building, with two becoming tragically injured," Nigro added. For those same reasons, the FDNY also praised the officers. "We are honored that these officers chose to bravely respond to a fire that took the lives of four people, including two of their fellow officers," FDNY spokesman Frank Dwyer told News 4. He also said that the firefighter

In the field of optics, a polarizing element is a device for converting linearly polarized light into circularly polarized light or circularly polarized light into linearly polarized light. The most popular method for obtaining a polarizing film of the type of glass is the method of forming a film in which a dichroic dye is mixed into a solution and the solution is applied to a glass substrate and dried. As a general method for obtaining a polarizing plate using a transparent substrate, the method of laminating a film of a polyvinyl alcohol resin (hereinafter abbreviated to PVA) and a film of a triacetyl cellulose resin (hereinafter abbreviated to TAC) is widely known. A polarizing film having excellent performance has been obtained by a production method in which a dichroic dye is previously added into PVA, and the mixture is dissolved and applied to a TAC film. In the production of a polarizing film by a conventional method, when an unexposed PVA solution is spread on a TAC film and the mixture is dried, there is a problem in which the PVA is cross-linked in the exposed portions, though the development of such phenomenon is not clarified yet. This problem may not be fatal in the case of a thin film, but in the case of a thick film of a thickness of 10  $\mu\text{m}$  or more, cracks occur in the polarizing film. For the reasons, in order to form a polarizing film of the type of glass with a thickness of 100  $\mu\text{m}$  or more, a method in which the PVA solution is applied to a TAC film and then the mixture is dried while the PVA is spread, or a method in which a PVA solution, an optically active compound, and a binder are applied to a TAC film and then dried has been proposed. In these methods, since a solvent is evaporated, a polarizing film is obtained in which the PVA or optically active compound is not cross-linked. However, even in the methods in which the PVA solution is spread, the PVA solution is dried while the PVA is spread, so that cracking tends to occur in the polarizing film. In the method in which the PVA solution, an optically active compound, and a binder are applied to a TAC film and then dried, the film tends to swell by the binder because the film is contacted with the binder, whereby cracking occurs in the polarizing
