A: This is a known issue for Windows users, but users of the Linux distro of STABLE have no issue running the game. Please consider sending a request to Ubisoft in order to solve this. There are many applications in which structural members, which have a cross section of a circular shape, are shaped at their ends by milling and cutting or like process. A method of making a billet with a cross section of a square or rectangular shape has a great advantage of the freedom of selection of materials and the ease of shape making operations. One well-known method of making a billet with a cross section of a square or rectangular shape is disclosed, for example, in Japanese Unexamined Patent Publication No. 60-182595. The method disclosed in this publication comprises shaping a bar member by milling or cutting to obtain a billet with a desired cross section; and drawing the billet while pressing the billet to elongate it. After drawing, the deformed billet may be heat treated. However, in the known method, it is difficult to make the billet with a long length, and such a billet requires to be firmly held in the drawing step and the heat treatment step. Even if the billet is drawn and heat treated, a portion around the edge of the billet tends to be unstably bent or curved. If the billet with a relatively large size is heat treated, the strength of the billet becomes low, so that it is often broken during the heat treatment or the like. If the billet with a relatively large size is drawn or deformed repeatedly, it is broken during the drawing or deformation. Lithographic masks can be used to create patterns in a layer of a semiconductor substrate during the manufacturing process of semiconductor devices. To create patterns that are sub-wavelength in size, commonly referred to as sub-wavelength images, a lithographic mask is often used as a patterning device to produce the desired patterns in the substrate. In most cases, an off-axis illumination (OAI) system is used as a source of illumination. OAI systems typically include a source of illumination that is tilted at an angle relative to the optical axis of the lithography system. The OAI system provides improved illumination along the direction of the tilt. The OAI system may also include an imaging system that is used to project the pattern of the lithographic mask onto a surface of the substrate.
