
Solucionario De Probabilidades Y Aplicaciones Estadisticas Rufino Moya Rapidshare High Quality

A: As you have a list of values, not a probability distribution, you can't just sample from it. But in the very extreme case, if you had an infinite list, you could take the value with the n th item in the list. In your example, this is easy to simulate, given a probability distribution: $\text{probA} = [0, 0, 0, 0.1, 0.2, 0.3]$ $\text{probB} = [0, 0, 0, 0.2, 0.4, 0.6]$

```
simulate_random_values =  
list(map(random.random,  
         probA, probB)) #  
[0.08936713494971441,  
 0.04117912600076916,  
 0.15156922378217838, #  
 0.3320411791260007,  
 0.1584250007691621,  
 0.4749940750769164]
```

In your case, where all the values are 0.5, however, it's actually trickier. You can try the following:

```
from random import  
randint probA = [randint(0, 1)  
for _ in range(N)] # list of 0.5
```

```
each probB = [randint(0, 1) for
_ in range(N)] # list of 0.5 each
simulate_random_values =
list(map(randint, probA,
probB)) # [0.555555556,
0.555555556, 0.555555556,
0.444444444, 0.444444444,
0.444444444] Q: CLR C#
```

AsyncTask BackgroundThread
How would i create a thread in
a class in C# - is it possible? i.e
if i do: new AsyncTask() How
would i run that - the function
in the string may involve for
example using another thread

to convert a bitmap to JPEG and then uploading it to the server - is that possible as a new class or would i have to make a class in the form itself and use the RunWorkerAsync to run a function in a different thread, do you know how to do this? A: Something like this:
Task t = new Task c6a93da74d
